#### Session 4

Implementation: How do our models/estimates make it into policy and industry applications

Ron Eguchi ImageCat, Inc. Workshop Nov 7-8, 2024 Eugene, OR

measuring stick

• Provide a **measuring stick** for assessing how bad and how likely a disaster could be

 Provide a measuring stick for assessing how bad and how likely a disaster could be

Expedia

- Provide a **measuring stick** for assessing how bad and how likely a disaster could be
- Serve as a disaster mitigation Expedia for selecting and justifying physical and planning adaptations

- Provide a **measuring stick** for assessing how bad and how likely a disaster could be
- Serve as a disaster mitigation Expedia for selecting and justifying physical and planning adaptations

actuary

- Provide a **measuring stick** for assessing how bad and how likely a disaster could be
- Serve as a disaster mitigation Expedia for selecting and justifying physical and planning adaptations
- Serve as an **actuary** for calculating potential insurance losses and premiums

8

- Provide a **measuring stick** for assessing how bad and how likely a disaster could be
- Serve as a disaster mitigation Expedia for selecting and justifying physical and planning adaptations
- Serve as an **actuary** for calculating potential insurance losses and premiums

safe routes

- Provide a **measuring stick** for assessing how bad and how likely a disaster could be
- Serve as a disaster mitigation Expedia for selecting and justifying physical and planning adaptations
- Serve as an **actuary** for calculating potential insurance losses and premiums
- Provide a tool for assessing safe routes for evacuation

- Provide a measuring stick for assessing how bad and how likely a disaster could
- Serve as a disaster mitigation Expedia for selecting and justifying physical and planning adaptations
- Serve as an **actuary** for calculating potential insurance losses and premiums
- Provide a tool for assessing safe routes for evacuation

ChatGPT

# Expedia

- Provide a **measuring stick** for assessing how bad and how likely a disaster could be
- Serve as a disaster mitigation Expedia for selecting and justifying physical and planning adaptations
- Serve as an **actuary** for calculating potential insurance losses and premiums
- Provide a tool for assessing safe routes for evacuation
- Serve as a ChatGPT tool for generating emergency response plans

Leveraging Earth Observation Data and Products to create a Comprehensive Tsunami Loss Estimation Platform – Impacts in a Changing Climate

Diego Melgar, **Ron Eguchi**, Shunichi Koshimura, Brendan Crowell, Kevin Kwong, Yajie Lee, Charlie Huyck, Shubharoop Ghosh, Georgiana Esquivias, ZhengHui Hu, David Small, and Sean Santellanes

#### EARTH SCIENCE APPLIED SCIENCES

## Knowledge gaps addressed by this study

- A <u>probabilistic framework</u> for modeling future tsunami hazards and risks
- A comprehensive view of the <u>financial and societal impacts</u> of tsunamis
- How to build and update data and models for exposure and impacts of <u>climate change</u> analysis using remote sensing
- How to incorporate <u>physics-based models</u> of earthquake generation and tsunami inundation into loss estimation
- A <u>unified methodology</u> (using geodesy) that can inform tsunami risk assessments in <u>real-time</u>

## Project Deliverables

- An operational model for <u>scenario-based and probabilistic</u> <u>risk/loss estimates</u> at short, decadal and long-time scales
- Pilot study results for the U.S. West Coast that demonstrate the use of the methodology.
- <u>Case studies</u> of how the platform is used to assess the efficacy of possible <u>adaptations</u> to reduce future risks to property and people

## Project Deliverables

- An operational model for <u>scenario-based and probabilistic</u> <u>risk/loss estimates</u> at short, decadal and long-time scales
- Pilot study results for the U.S. West Coast that demonstrate the use of the methodology.
- <u>Case studies</u> of how the platform is used to assess the efficacy of possible <u>adaptations</u> to reduce future risks to property and people

Another priority for project --- meaningful outreach and end-user engagement

# Pre-Award Demonstration Study ...

#### Cascadia Earthquake

M 9.0 Cascadia Subduction Zone 6-hour duration

#### **Study Area**

Ocean Shores, Western Washington

#### **Study Products:**

Loss estimates (\$) for residential & commercial construction

Casualty estimates using different assumptions re. community preparation & evacuation times

#### **Intended Users**

Local and Regional Govts NOAA – rapid postearthquake loss estimation FEMA – flood insurance program Re/Insurance companies The Public

## Study Area: Ocean Shores, Washington

# Earthquake sources

- As part of the NASA DISASTERS work, we've produced a code that can efficiently generate thousands of realistic earthquake sources on any fault and for any magnitude range
- Methodology is being applied to the US but can be extended globally
- Next step to focus on probabilistic modeling to capture comprehensive assessment of future risks

# Earthquake sources

• This allows you to empirically characterize the potential distribution of near-source tsunami inundations simply by modeling the tsunamis for all these earthquakes

#### UTM10

#### Cascadia Mw9.0 hh:mm Duration: 6 Hours 00:00

## Inundation Model Example (M9)

#### Inundation Hazard (>0m)

#### Inundation Hazard (≥2m)

24

SafeZone

WA Buildings

17

#### Structural and Contents Damage by Flow Depth

Distribution of Structural and Contents Damage by flow depth

## Financial Losses, including Downtime ...

#### **Building and Population Exposure**

Time	Buildings	Population	Total Pop.	Pop.%
10	892	1,034	1,034	14%
20	1,484	1,720	2,754	38%
30	1,941	2,250	5,004	70%
40	1,358	1,574	6,578	92%
50	469	544	7,122	99%
120	30	35	7,157	100%

	Structural + Non- Structural	Contents	Downtime	Total
Exposure	\$ 4,768,293,803	\$ 2,384,146,901	-	\$ 7,152,440,704
Loss per "Surge Damage Function"	\$ 3,426,620,607	\$ 1,644,658,161	\$ 1,133,660,175	\$ 6,204,938,943
Loss per HAZUS Tsunami Damage Functions	\$ 3,167,237,250	\$ 1,999,256,884	\$ 1,056,111,316	\$ 6,222,605,450

#### Estimation of Number of Injuries and Deaths from M9.0 Scenario

#### **Casualty Modeling, including Evacuation Times**

Preliminary results of pedestrian evacuation time required to reach full-safety based on a slow walk (1.1 meters/sec) scenario to fast walk (1.52 meters/sec) scenario.

Adaptation planning framework for reducing vulnerabilities and enhancing coastal resilience

Physical Adaptation and Policy Planning

Climate-Proofing Wholesale & Retail Buildings

Financing and Financial Instruments for Adaptation

Training, Capacity Building, Knowledge Transfer for Climate Adaptation & Business Continuity Planning

#### Six Main Work Packages:

- 1. EQ Source Modeling & Tsunami Inundation
- 2. Impact Analysis
- 3. Forecasting Impacts:
  - i. Long-Term,Probabilistic &Climate Change

ii. Real-Time

- 4. Platform Development
- 5. Validation & Pilot Studies
- 6. Outreach & End-User Engagement

Workshops & Advisory Panel meetings

#### NSI data-building specific data set for risk assessment National Structure Inventor

- National Structure Inventory from USACE
- An amalgamation of building footprints and assessor data nationwide
- Data fusion process often leads to errors.
- Many assumptions required for use in risk modeling

# Washington EMD improvements

- Labor intensive update of the data for areas in the tsunami risk zone
- 30 to 40% less building value in the ASCE tsunami hazard zone.
- *Distribution* of exposure varies significantly.

• Added exposure at the marina

- Added exposure at the marina
- Removed exposure where fences of other factors create illusion of buildings

- Added exposure at the marina
- Removed exposure where fences of other factors create illusion of buildings
- Remove "Stacked" buildings from NSI

\$495,569 \$1,591,849 \$3,009,614 \$1,053,000 \$1,928,312 \$1,928,312

**Building Value Total** 

WA HAZUS Default

WA EMD Improved

- Added exposure at the marina
- Removed exposure where fences of other factors create illusion of buildings
- Remove "Stacked" buildings from NSI
- Remove out-buildings

- Added exposure at the marina
- Removed exposure where fences of other factors create illusion of buildings
- Remove "Stacked" buildings from NSI
- Remove out-buildings
- Adjust attributes

WA HAZUS Default

WA EMD Improved

# Application of EO

- Estimation of regional story heights
- Checking volumetric estimates of buildings against NSI to identify "stacked" buildings of regions of under-estimation
- "Outlying building factor" for rural areas
- Addressing faulty attribute data

Example of urban development patterns in Tunisia, used to build exposure data

#### Example: Crescent City

- Suspicious "Exterior Wall" identification
- Hazus uses "Exterior Wall" and occupancy to infer vulnerability by region
- Brick is much more robust than wood frame.
- Random sample of 100 buildings reveals classification of Masonry exterior is primarily stucco cladding

Determination	Count
No Streetview or visibility issues.	5
Brick or Brick Veneer	1
Stucco	78
Siding- wood or vinyl.	16

## Example: Crescent City

- Moderate resolution remote sensing data and interpreted data sets used to identify "Development patterns"
- Using engineering expertise, NSI can be updated probabilistically based on these zones
- Example illustrates preliminary work extracting regions with primarily residential development, and update of structure type for HAZUS Modeling.
- Analysis captures significantly more vulnerability in Crescent City.

False color image used to accentuate urban development patterns Red: mostly light residential. Yellow: Light urban ImageCat, Inc.
